

Parasite eggs are released into the ocean through whale poop

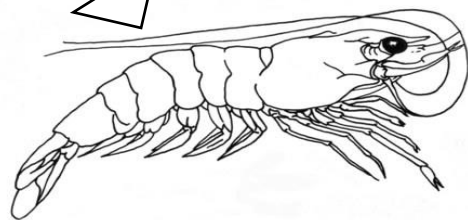

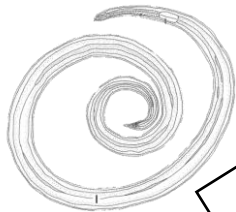

The big fish and the larvae are eaten by a killer whale, and the larva grows into an adult in the whale's stomach, they lay eggs that will be released in their poop all over again

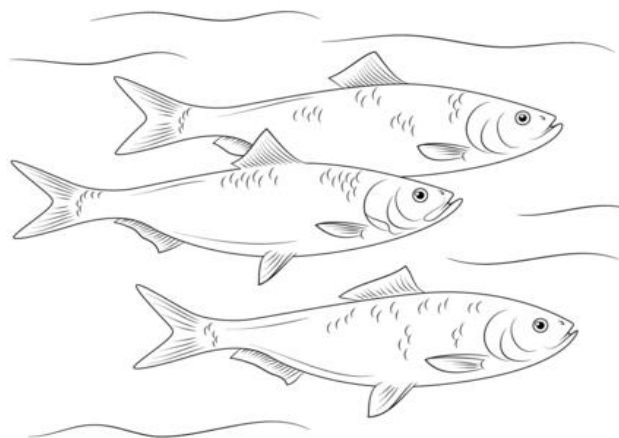

## Parasitic worm (Anisakid) life cycle

The egg hatches into a larva in the ocean

A small crustacean like a shrimp eats the larva

The crustacean and the larva are eaten by a small fish

The small fish and the larva are eaten by a bigger fish like this salmon
